Written by prominent international experts from industry and academia, the Wiley Encyclopedia of Composites, Second Edition presents over 265 new and revised articles addressing the new technological advances in properties, processing, formulation, design, analysis, evaluation, manufacture, testing, and reliability of composites. The entire range of industrial applications of composites is covered.

About 30% of all polymers produced each year are used in the civil engineering and building industries. In addition to construction, polymer composites are also used in transportation (moulded parts, fuel and gas tanks), aerospace (satellites and aircraft structures), marine, biomedical (dental fixtures, prosthetic devices), electronics and in recreation industries.

Polymer matrix composites are most advanced composites; these composites have different types of fibers (natural and synthetic) as reinforced material in different types of polymers such as thermoplastic or thermoset polymers, which can mold in different shapes and sizes, and make different types of fashioned materials [49,50]. The polymer composites have very good mechanical strength and stiffness, along with resistance to corrosion.

Most dental polymer composites are light curing composites, which harden by irradiation with visible light 400-500nm. The properties of polymer composites are considerably influenced by the fillers ...

characterization of a composite structure is far more complex than that of a metal structure if one considers that the techniques for the evaluation and measurement of some composite properties, such as fracture toughness and compressive strength, are still debatable. Synthetic polymers. Credit for first recognizing the chemical nature of polymers is usually given to German chemist Hermann Staudinger (1881 - 1965). In 1926, Staudinger suggested that polymers are very large molecules consisting of one or two simple units (the monomers) repeated over and

Articles in the Encyclopedia cover the fundamental and practical aspects of the polymer field, including polymeric materials, polymer properties, polymerization methods, processing, and uses. Special emphasis is put on new and advanced polymeric materials for various applications (e.g. coating, water filtration, energy, and biomedical applications, etc.), new and improved characterization and analytical methods, and modern processing technology.

Organic matrix/ceramic aggregate composites include asphalt concrete, polymer concrete, mastic asphalt, mastic roller hybrid, dental composite, syntactic foam and mother of pearl. Chobham armour is a special type of composite armour used in military applications.

Composite material - Wikipedia

The fibers used in high-performance composites are made of a wide variety of materials, including glass, carbon, boron, silicon carbide, aluminum oxide, and certain types of polymers. These fibers are generally interwoven to form larger filaments or bundles.
