Involute Splines Rudolf Och Frenco, Altdorf, West Germany Gears and Splines Engineering design requires many different types of gears and splines. Although these components are rather expensive, subject to direct wear, and difficult to replace, transmissions with gears and splines are required for two very simple reasons:

Involute spline shafts and bushings are thermal refined to have good abrasion-resistance. Spline bushings may be made in CAC (bronze) type material as a special custom order item. The surface strength of Spline The design concept of the spline surface strength is the same as that of a key. Here is the formula for the allowable transmission

Involute Spline Shafts & Bushings

Splines Mott, Fig. 11-6 Splines can be thought of as a series of axial keyways with mating keys machined onto a shaft. There are two major types of splines used in industry: 1) straight-sided splines, and 2) involute splines. Splines provide a more uniform circumferential transfer of torque to the shaft than a key.

Tooth engagement in involute spline couplings is difficult to predict due to the complex geometry and even more complex manufacturing processes. Although manufacturing is closely controlled, with precision tooling, engagement problems persist. Presented herein is a detailed study of an involute spline coupling and its associated

fitting. Spline are made in two forms square and involutes. Spline profiles are mostly important in spline cutting process so the analysis of spline profile is most important in the process of splines manufacturing. The designation of a spline profile is module, pitch circle diameter, number of teeth.

This app calculate the shear stress, contact stress and safety factors of a involute spline shaft under a defined torque. This calculation gives a good direction on design and will help to define sizes and

lengths of shafts, and therefore the parts that are assembled on it.
