A computer network is a digital telecommunications network which allows nodes to share resources. In computer networks, computing devices exchange data with each other using connections between nodes. These data links are established over cable media such as wires or optic cables, or wireless media such as Wi-Fi.. Network computer devices that originate, route and terminate the data are called ...

Database Mail, as you would expect from its name, is a solution for sending e-mail messages from the SQL Server Database Engine to users. Using Database Mail, database applications can send e-mail messages that can, for example, contain query results or simply alert a user about an event that occurred in the database.

Suitable for users at sea, on land and in flight, SkyFile® Mail provides reliable and cost-effective email, fax and SMS messaging on VSAT, Inmarsat, Iridium and Thuraya satellite terminals.

### **SkyFile Mail - Marlink**

In Figure 1, a network layer firewall called a "screened host firewall" is represented. In a screened host firewall, access to and from a single host is controlled by means of a router operating at a network layer. The single host is a bastion host; a highly-defended and secured strong-point that (hopefully) can resist attack.

Total protection from known and unknown threats delivered to corporate network by incoming files. ODIX offers malware prevention through file sanitization based on advanced True Content Disarm & Reconstruction (True CDR™) technology – delivering an end-to-end solution for both known and unknown malware-based cyberattacks – viruses, ransomware, APTs and Zero-day attacks.

## **ODIX Content Disarm and Reconstruction (CDR)**

ACL (Access Control List) A method of keeping in check the Internet traffic that attempts to flow through a given hub, router, firewall, or similar device. Access control is often accomplished by creating a list specifying the IP addresses and/or ports from which permitted traffic can come.

## **Network Security Glossary | WatchGuard Technologies**

Network address translation (NAT) is a method of remapping one IP address space into another by modifying network address information in the IP header of packets while they are in transit across a traffic routing device. The technique was originally used as a shortcut to avoid the need to readdress every host when a network was moved.

## **Network address translation - Wikipedia**

Generating a list of active server ports. While command line utilities such as netstat can give you a real-time view of network connections (both incoming and outgoing), it does not provide historical reporting. Some network ports on a server may only become active when certain applications are used.
