Developmental biology is the study of the process by which animals and plants grow and develop. Developmental biology also encompasses the biology of regeneration, asexual reproduction, metamorphosis, and the growth and differentiation of stem cells in the adult organism.. In the late 20th century, the discipline largely transformed into evolutionary developmental biology

Molecular Biology of the Cell (MBoC) Volume 19, Number 17, August 15, 2018. Molecular Biology of the Cell () is a premier journal for research in all areas of cell biology, from biophysics to genetics to neuroscience. Its 27 online issues per year include Special Issues in the important areas of Quantitative Cell Biology, Forces on and within Cells, and the Cell Biology of Stem Cells.

Cell Wall - What's it for? Cell membranes surround every cell you will study. Cell walls made of cellulose are only found around plant cells and a few other organisms. Cellulose is a specialized sugar that is classified as a structural carbohydrate and not used for energy. If a plant cell is like a water balloon, the cell wall is like a cardboard box that protects the balloon.

In cell biology, a bleb is a bulge or protrusion of the plasma membrane of a cell, human bioparticulate or abscess with an internal environment similar to that of a simple cell, characterized by a spherical, bulky morphology. It is characterized by the decoupling of the cytoskeleton from the plasma membrane, degrading the internal structure of the cell, allowing the flexibility required to ...

x Hematopoietic cell transplantation (HCT) is a curative treatment for many hematologic

malignancies and nonmalignant disorders, although a variety of complications and late effects may occur [1-3]. Non-graft-versus-host disease (GVHD) ocular complications are generally uncommon after HCT but can cause prolonged morbidity, affecting activities of daily living and quality of life.

Proteomic and genetic studies have identified protein components of several membraneless organelles 23, 34, 35, 36. These studies suggest that multivalency of adhesive domains and/or linear motifs is a defining feature of proteins (and perhaps RNA molecules) that drive phase transitions.

Cell biology is the study of cells—the fundamental units of structure and function in living organisms. Cells were first observed in the 17th century, when the compound microscope was invented. Before that time, the individual organism was studied as a whole in a field known as organismic biology; that area of research remains an important component of the biological sciences.
