### **The 8088 And 8086 Microprocessors**

The Intel 8088 ("eighty-eighty-eight", also called iAPX 88) microprocessor is a variant of the Intel 8086. Introduced on July 1, 1979, the 8088 had an eight-bit external data bus instead of the 16-bit bus of the 8086. The 16-bit registers and the one megabyte address range were unchanged, however. In fact, according to the Intel documentation, the 8086 and 8088 have the same execution unit (EU ...

The 8086 (also called iAPX 86) is a 16-bit microprocessor chip designed by Intel between early 1976 and June 8, 1978, when it was released. The Intel 8088, released July 1, 1979, is a slightly modified chip with an external 8-bit data bus (allowing the use of cheaper and fewer supporting ICs), and is notable as the processor used in the original IBM PC design, including the widespread version ...

Earlier this month, Intel introduced first budget dual- and quad-core systems on a chip, built on "Gemini Lake" design. As you may know, previous generation of processors for inexpensive desktop and notebook computers was based on "Apollo Lake" design, which was produced on 14nm technology, and combined 2 or 4 "Goldmont" CPU cores, Intel HD 500 or HD 505 graphics, DDR3 / DDR4 memory controller ...

What Computers are Made From. The basic element in a computer can be an electromagnetic relay, a vacuum tube, or a transistor. All three of these can function as switches which are electrically controlled.

El Intel 4004 (i4004), un CPU de 4bits, fue el primer microprocesador en un simple chip, así como el primero disponible comercialmente. Aproximadamente al mismo tiempo, algunos otros diseños de CPU en circuito integrado, tales como el militar F14 CADC de 1970, fueron implementados como chipsets, es decir constelaciones de múltiples chips.
